```
21st May 2026

print('Hello World')
```

```
print('Connecting to ChatGPT....')
```

```
# Store things in variables
name = 'Kartik'

print(name)
```

```
# There are different types of data in python
# The two datatypes that we will initially deal with are:
# strings (words and sentences) -> strings are always enclosed in ''
(single quotes)
# Integers and floats (numbers, integers -> whole numbers and floats ->
decimal)
```

```
api_key = 'sk-12345678' # string

user_question = 'How to bake a cake' #string

max_tokens = 500 #integer
temperature = 0.7 #float
price_per_token = 0.002 #float
```

🛑 Challenge 1: The "Configuration File"

Scenario: You are setting up a new AI bot. You need to define its settings before it starts.
Task:

1. Create a variable `bot_name` with the name "SummarizerBot".
2. Create a variable `model_version` with the value `4.0`.
3. Create a variable `is_active` (Boolean) and set it to `True`.
4. Print the `bot_name`.

```
# F string
# Prompt Templates for your users
# As we cannot trust them to write good prompts

user_topic = 'Agentic AI'
```

```
prompt = f'You are a an expert essay writing agent. Web search and
check facts before writing the essay. The topic of the essay is
{user_topic}'
print(prompt)
```

🛑 Challenge 2: The "Email Generator"

Scenario: You are building a tool to auto-reply to emails. **Task:**

1. Define a variable `sender_name` (e.g., "Alice").
2. Define a variable `tone` (e.g., "Professional").
3. Use an f-string to print: `"Drafting a Professional reply to Alice..."`

---

22 May 2026

Challenge 3: The Model Switcher

Task: Create a variable `model` set to `"gpt-3.5"`. Use an f-string to print: `"Switching backend to gpt-3.5..."`.

```
# Task: Create a variable model set to "gpt-3.5".

# Use an f-string to print: "Switching backend to gpt-3.5...".

model = 'gpt-3.5'

prompt = f'Switching backend to {model}...'

print(prompt)
```

```
# Control Flow (The Agent's Decision Making)

sentiment_score = 0.5       # 0.0 is negative and 1.0 is positive

if sentiment_score > 0.5:
```

```
    print('This statement is positive')

else:

    print('This statement is negative')

# Condition 1: if greater than 0.8 then positive

# Condition 2: else if less than 0.2 then negative

# Condition 3: else neutral

sentiment_score = 0.5

if sentiment_score > 0.8:

    print('This statement is positive')

elif sentiment_score < 0.2:

    print('This statement is negative')

else:

    print('This statement is neutral')
```

🛑 Challenge 4: The "Safety Filter"

Scenario: Your AI is not allowed to discuss politics. **Task:**

1. Create a variable `topic` = `"Politics"`.
2. Write an `if` statement:
    - If `topic` is `"Politics"`, print `"⛔ Topic Forbidden."`
    - Else, print `"✅ Processing..."`

```
topic = 'Politics'
# = is used to assign a value into variable
# == is used to compare if two things are equal

if topic == 'Politics':
    print('⛔ Topic Forbidden.')
else:
```

```
    print("✅ Processing...")
```

```
 # Loops (Automation for Repetitive Process)

 # A list of documents
documents = ['invoice.pdf', 'receipt.png', 'contract.docx',
'resume.pdf']

print('------Starting to process-------')

for doc in documents:
    print(doc)
```

```
# Create a list: inputs = ["Hi", "Hello there", "Good morning AI"].

# Loop through inputs.

# Inside the loop, print: "Processing {message}"
```

```
inputs = ["Hi", "Hello there", "Good morning AI"]

for input in inputs:
    print(f'Processing {input}')
```

Practice Challenges:

The Temperature Check

Task: Create a variable `temp` (float) set to `0.8`. Write an `if` statement: If `temp` is greater than `0.5`, print `"Creative Mode On"`.

temp = 0.8

if temp > 0.5:

    print("Creative Mode On")

The "System Prompt" Configuration

Task: Set `role` = `"Teacher"` and `topic` = `"Math"`. Create a single variable `prompt` that says `"You are a Teacher. Teach me Math."` using f-strings. Print it.

Scenario A: The "AI Support Router"

Context: You are building a system that reads customer emails and decides which AI Agent should handle them .

- If the email contains the word **"refund"**, route it to the **Billing Agent**.
- If it contains **"password"**, route it to the **Security Agent**.
- Otherwise, route it to the **General Support Agent**.

Data: `emails = ["I forgot my password", "I want a refund please", "Hello, how are you?"]`

Your Task: Write a loop that goes through each email. Inside the loop, use `if/elif/else` logic with the `in` operator (e.g., `if "word" in variable:`) to print which agent is handling which email.

```
emails = ["I forgot my password", "I want a refund please", "Hello, how are you?"]

for email in emails:

    if 'refund' in email:

        print('Billing Agent')

    elif 'password' in email:

        print('Security Agent')

    else:

        print('General Support Agent')
```

25th May 2026

```
# Data Structures in Python

# I want to store names of 5 students

student1 = 'Kartik'

student2 = 'Rohan'

student3 = 'Satish'

student4 = 'Bablu'

student5 = 'Ravi'

# Not efficient at all!!
```

```
# Lists -> ordered collection of items (strings, integers, floats)

students = ['Kartik', 'Rohan', 'Satish', 'Bablu', 'Ravi']

print(students)
```

```
# List of tools for our agent

tools = ['web_search', 'calculator', 'image_generator',
'code_interpreter']

print(tools)
```

```
# What if I only want to print the first tool?
# Counting in python begins from 0 (index)
print(tools[0])
```

```
print(tools[2])
print(tools[-1])
print(tools[-4])
# What if I want to add a new element to this list?
tools = ['web_search', 'calculator', 'image_generator',
'code_interpreter']
```

```
# To add a new element we use the 'append' function
tools.append('todo')
print(tools)
```

```
memory = []
memory.append('User name is Alice')
memory.append('User lives in USA')

print(memory)
```

```
# Where lists will be useful in agentic AI?
# 1. Adding tools to the agent
# 2. Storing the list of messages from past conversations to maintain
context
```

```
# Dictionary
# Key Value Pairs
student1_details = ['Alice', 8.0, 7, 5]
student2_details = ['Bob', 9.0, 6, 5]

student1 = {
    'name': 'Alice',
    'cgpa': 8.0,
    'hours_studied': 7,
    'friends': 5
}
```

```
# Where dictionaries will be useful in agentic AI?
# Very important to add roles to message (who said what) before storing
it
message = {
    "role": "user",
    "content": "Hello AI",
    "timestamp": "10:00AM"
}
```

```
print(message)
```

```
# One message is a dictionary?
# How can I store multiple such messages
# Using lists of dictionary

conversation_history = [
    {"role": "user", "content": "Hello AI"},
    {"role": "AI", "content": "How can I help you?"},
    {"role": "user", "content": "What is the weather in Delhi?"}
]

# I want to only print the last core message
conversation_history[-1]['content'] # REMEMBER THIS
```

```
# Conversation_history[2] why can't we use index 2
# Will begin with practice challenges on List of Dictionaries
```

---

26 March 2026

Challenge 1: The "Tool Box" (Lists)

Scenario: Your agent starts with one tool: `"Search"`.
Task:

1. Create a list `agent_tools = ["Search"]`.
2. Use `.append()` to add `"Calculator"`.
3. Use `.append()` to add `"Calendar"`.
4. Print the **second** tool in the list.

```
agent_tools = ['Search']

agent_tools.append('Calculator')

agent_tools.append('Calendar')

print(agent_tools[1])
```

Challenge 2: The "Model Config" (Dictionaries)

Scenario: You need to define the settings for a GPT-4 call.
Task:

1. Create a dictionary named `config`.
2. Add keys:
    - `"model"`: "gpt-4"
    - `"max_tokens"`: 200
    - `"temperature"`: 0.5
3. Print the sentence: `"Using model gpt-4 with temp 0.5"` by accessing the dictionary values.(Hint: using f-string)

```
config = {

    "model": "gpt-4",

    "max_tokens": 200,

    "temperature": 0.5

}

print(f"Using model {config["model"]} with temp
{config["temperature"]}")
```

Challenge 3: The "Chat Simulator" (Combining Both)

Scenario: You are building a loop that prints out a chat history nicely. **Task:**

1. Copy this list:

history = [

{"role": "user", "content": "Hi"},

{"role": "ai", "content": "Hello there!"}

]

2. Write a **Loop** (`for msg in history:`).

3. Inside the loop, print: `"[ROLE]: CONTENT"`. (e.g., `[user]: Hi`).

```
history = [
    {"role": "user", "content": "Hi"},
    {"role": "ai", "content": "Hello there!"}
]

for msg in history:
    print(f"[{msg['role']}]: {msg['content']}")
```

```
# The API Response Parser
# API -> Application Programming Interface
# API is used to communicate with other systems over a network
# API uses a structure to communicate called as JSON -> Lists & Dictionaries (set or rules)

api_response = {
    "id": "chat-123",
    "usage": {"prompt_tokens": 50, "completion_tokens": 10},
    "choices": [
        {
            "index": 0,
            "message": {
                "role": "assistant",
                "content": "The sky is blue."
            },
            "finish_reason": "stop"
```

```
        }
    ]
}
# Extract only the content from this api response
api_response['choices'][0]['message']['content']
```

```
# Print only the finish reason :
# print only 'stop'
api_response['choices'][0]['finish_reason']
```

```
# Mini Project - The Log Parser
# The log -> keep noting down what is happening
# For eg. Note down every 5 seconds if our agent is working well
# We need to parse (understand) this log to check for errors
# For that we are creating a log parser
```

```
# Prerequisite: 1 Reading files
# Before we parse logs, logs must be stored somewhere in a file
# We need to learn to read a file in python

# file is a nickname for our example.txt
# r means I want to read the file
with open('example.txt', 'r') as file:
    content = file.read()
    print(content)
```

```
# with -> automatically closes the file once your work is done

# leaving the file open is a waste of resources for python
```

```
# Pre-Requisite 2: The split() method

log = "2026-01-01 ERROR Login_Failed"

# Split the line into words

parts = log.split() # by default splits on spaces

timestamp = parts[0]

status = parts[1]

message = parts[2]

print(f'Time: {timestamp}, Status: {status}')
```

```
# Mini Project 1

# Step 1: To store the different findings, I will create an empty list

error_logs = []

# We will keep parsing the log file and keep storing the errors in this
list
```

```
with open('server.log', 'r') as file:

    # readlines turns the file into a list of strings for each line

    lines = file.readlines()

    for line in lines:

        # to clean extra characters we use the strip()

        clean_line = line.strip()

        if "ERROR" in clean_line:

            parts = clean_line.split()

            timestamp = f'{parts[0]} {parts[1]}'

            error_logs.append(timestamp)
```

Practice Challenge: "The Chat Filter"

Scenario: You have a chat history file. You need to extract only the messages sent by the **"User"** (ignoring the "Assistant").

Data: Create a file named `chat.txt`:

User: How do I reset my password?

Assistant: Go to settings.

User: It is not working.

Assistant: Try clicking "Forgot Password".

User: Okay thanks.

Your Task:

1. Read `chat.txt`.
2. Loop through lines.
3. If the line starts with `"User:"`:
    - Split the line to separate the "User:" tag from the actual message.
    - *Hint:* You might want to split by `": "` (colon space).
4. Print just the **message** part (e.g., "How do I reset my password?").

Tokenisation

```
sentence = 'I am going to play cricket'
tokens = sentence.split()
tokens
```

```
sentence = 'The microtransactional system was counterintuitive'
tokens = sentence.split()
tokens

# Sub words or tokens
# Bigger words need to be broken down more into tokens (sub words)
# 1 token is not equal to 1 word
# 1 token = 3/4 word
```

```
from transformers import AutoTokenizer
```

```
# This is actually a machine learning model, not a normal function
# This model has been already trained (pre trained)
# Name of the model is bert-base-uncased
# This model has been trained by USA (for english)
tokenizer = AutoTokenizer.from_pretrained('bert-base-uncased')

tokens = tokenizer.tokenize(sentence)
tokens
```

```
sentence = 'नमस्ते, आप कैसे हैं'
tokens = tokenizer.tokenize(sentence)
tokens
sentence = 'Hello, how are you'
```

```
tokens = tokenizer.tokenize(sentence)
tokens
```

```
# The cost of using LLMs is determined on the basis of tokens
# If you talk to it in english
```

```
pip install indic-nlp-library
```

```
from indicnlp.tokenize import indic_tokenize

sentence = 'வணக்கம், நீங்கள் எப்படி இருக்கிறீர்கள்?'
tokens = indic_tokenize.trivial_tokenize(sentence)
tokens
```

—----------

1st June 2026

```
# spaCy -> industry standard library for NLP
# it has a pre-trained model that already knows english grammar
```

```
# Step 1: Install spaCy
!pip install spacy -q # -q means quiet installation
```

```
# Step 2: Download the pre trained model
!python -m spacy download en_core_web_sm
```

```
!python -m spacy download en_core_web_md
```

```
import spacy

nlp = spacy.load('en_core_web_md')

news_article = '''
Apple CEO Tim Cook announced a new office in Singapore yesterday.
The tech giant plans to hire 500 engineers.
Meanwhile, Elon Musk is visiting Berlin to check on the Tesla factory.
'''
```

```
result = nlp(news_article)
```

```
result.ents
```

```
for entity in result.ents:
    print(f"Word: {entity.text} | Category: {entity.label_}" )
```

Challenge 1: The "People Finder"

Scenario: You are building a tool that scans news for celebrity mentions. You only care about **PERSON** entities.

Task: Modify the loop to uses an `if` statement.

- **IF** the `entity.label_` is `"PERSON"`, print it.
- **ELSE**, do nothing.

Challenge 2: The "Redactor" (Privacy Bot)

Scenario: You need to hide sensitive information. You want to replace all **Names** with the word `[REDACTED]`.

Task:

1. Create a variable `clean_text` equal to the original `news_article`.
2. Loop through entities.
3. If the label is `"PERSON"`:
    - Use the Python replace function: `clean_text = clean_text.replace(entity.text, "[REDACTED]")`.
4. Print the new `clean_text`.

```
import spacy

nlp = spacy.load('en_core_web_md')

text = 'The child is going to the park to look at a big tree'

result = nlp(text)
```

```
clean_words = []
```

```
for token in result:

    if not token.is_stop:

        clean_words.append(token)

clean_words

# Are LLMs the only models to deal with language?
# Is text generation the only language task?

# There are other language tasks also apart from text generation

# Sentiment Analysis -> classifying sentences into positive, negative
(or neutral)
# The car broke down again -> negative
# I love this new phone -> positive

# Models exist for sentiment analysis
# Do we need API for these models as well? Or is there any free way
available?

# Free way is available -> using HuggingFace -> Collection of free
models.
```

```
!pip install transformers -q
```

```
from transformers import pipeline

classifier = pipeline(
    task='sentiment_analysis',
    model='distilbert-base-uncased-finetuned-sst-2-english',
    device=0 # This tells to run on GPU (0), instead of CPU (-1)
)
```

```
text = 'I absolutely loved the movie! The plot was incredible.'

result = classifier(text)

print(result)
```

Practice Challenges

Now we will try different models from the Hugging Face Hub. You just need to change the `task` and `model` name.

Challenge 1: The "Language Detector"

Scenario: You have a dataset of mixed languages. You need to identify them. Task:

1. **Initialize a pipeline with `task="text-classification"`.**
2. **Use the model: `papluca/xlm-roberta-base-language-detection`.**
3. **Test it on: `"Bonjour tout le monde"` and `"Hello world"`.**

```
# 1. Load the Language Detection Pipeline
lang_detector = pipeline(
    task="text-classification",
    model="papluca/xlm-roberta-base-language-detection",
    device=0
)

# 2. Test Data
texts = ["Bonjour tout le monde", "Esta es una frase en español",
"Hello world"]

# 3. Run Inference
results = lang_detector(texts)

print("\n--- 🌍 LANGUAGE DETECTION ---")
for text, res in zip(texts, results):
    print(f"Text: '{text}' -> Language: {res['label']}")

# Expected Output: 'fr' (French), 'es' (Spanish), 'en' (English)
```

Challenge 2: The "Zero-Shot Classifier" (Magic)

Scenario: Usually, models are trained for specific labels (Positive/Negative). But what if you want *custom* labels like "Sports",

"Politics", or "Cooking"? Concept: Zero-Shot Classification lets you invent labels on the fly without training!

Task:

1. **Load a pipeline with `task="zero-shot-classification"`.**
2. **Use model: `facebook/bart-large-mnli`.**
3. **Classify the text: `"Ronaldo scored a magnificent goal in the final minute."`**
4. **Provide candidate labels: `["politics", "sports", "cooking"]`.**

```
print("⬇️ Loading Zero-Shot Model (This is a bigger model, might take 30s)...")

# 1. Load Model

Practice Challenge: "The Code Explainer"

Scenario: You want an AI that only explains Python code briefly.

Task:

1. Define a `system_instruction` that says: *"You are a Python expert. Explain code in 1 sentence."*
2. Define a `user_input`: *"print('Hello World')"*
3. Call the function and print the result.

```
result = query_local_llm("print('Hello World')", 'You are a Python
expert. Explain code in 1 sentence.')
result.split("<|assistant|>")[-1].strip()
```

Practice Challenge: "The Movie Recommender"

Scenario: You are building a movie app. Users describe a plot, and you find the movie.

Your Task:

1. Create a **new collection** named `"movies"`.

2. Add these documents (Movies):
    - ID "1": "A group of heroes fight a purple alien to save the universe." (Avengers)
    - ID "2": "A ship hits an iceberg and sinks in the Atlantic." (Titanic)
    - ID "3": "A lion cub runs away but returns to become king." (Lion King)
3. Query the database with: **"A boat disaster"**.
4. Print the matched movie description.

# Employee Handbook

## 1. Remote Work Policy

The company supports a flexible hybrid work environment designed to
balance productivity, collaboration, and employee well-being.

### Eligibility

* Full-time employees who have completed their probationary period are
eligible for remote work.
* Temporary employees, interns, and contractors may be eligible at the
discretion of their department head.

### Standard Remote Work Schedule

* Employees may work remotely up to 3 days per week.
* Teams may establish designated in-office collaboration days.
* Employees must maintain core availability between 10:00 AM and 4:00
PM local time.

### International Remote Work

* Working from international locations requires approval from the VP of
Human Resources at least 30 days in advance.
* Employees must comply with local employment, tax, immigration, and
data protection regulations.
* The company reserves the right to deny requests based on legal,
security, or operational concerns.

### Home Office Requirements

* Employees must maintain a secure and professional workspace.
* Reliable internet connectivity capable of supporting video
conferencing is required.
```

```
* Confidential company information must not be accessible to
unauthorized individuals.

---

## 2. Paid Time Off (PTO) and Leave Policies

### Annual PTO

* Full-time employees receive 20 days of paid time off annually.
* PTO accrues monthly throughout the calendar year.
* Unused PTO does not roll over unless required by local law.

### Sick Leave

* Sick leave is provided on an unlimited basis to support employee
health.
* A physician's note may be required after 3 consecutive business days
of absence.
* Abuse of sick leave policies may result in disciplinary action.

### Bereavement Leave

* Up to 5 paid days for immediate family members.
* Up to 2 paid days for extended family members.

### Parental Leave

* Primary caregivers receive up to 16 weeks of paid leave.
* Secondary caregivers receive up to 8 weeks of paid leave.
* Leave may be taken continuously or in approved segments within the
first year following birth, adoption, or foster placement.

### Jury Duty and Civic Leave

* Employees are encouraged to fulfill civic responsibilities.
* Paid leave may be provided for jury service and approved governmental
obligations.

---

## 3. Hardware and Equipment Policy
```

```
### Standard Equipment Package

The company provides:

* One company-issued laptop.
* Necessary chargers and accessories.
* Security software and endpoint protection tools.

### Home Office Stipend

Employees receive a one-time $500 stipend for:

* Desk equipment.
* Office chairs.
* External monitors.
* Lighting and productivity accessories.

### Additional Equipment Requests

Additional hardware may be requested through the IT Service Portal,
including:

* Multiple monitors.
* Ergonomic keyboards.
* Specialized peripherals.
* Docking stations.

Manager approval is required before purchase.

### Asset Management

* Company equipment remains company property.
* Employees must return all assets upon termination of employment.
* Lost or damaged equipment must be reported within 24 hours.

---

## 4. Code of Conduct

Employees are expected to:

* Treat colleagues with respect and professionalism.
* Foster an inclusive and welcoming workplace.
```

```
* Avoid discriminatory, harassing, or retaliatory behavior.
* Follow all applicable laws and company policies.

The company maintains a zero-tolerance policy toward:

* Workplace harassment.
* Threats of violence.
* Bullying.
* Discrimination based on protected characteristics.

---

## 5. Workplace Communication Standards

### Email Expectations

* Internal emails should generally receive acknowledgment within one
business day.
* Time-sensitive requests should be clearly marked.

### Meeting Etiquette

* Employees should arrive prepared and on time.
* Cameras are encouraged during virtual meetings unless otherwise
stated.
* Meeting organizers should provide agendas whenever practical.

### Collaboration Tools

Authorized collaboration tools include:

* Company email systems.
* Approved messaging platforms.
* Company-approved project management software.

---

## 6. Information Security Policy

### Password Requirements

* Minimum length of 14 characters.
* Multi-factor authentication is mandatory.
```

```
* Password sharing is prohibited.

### Data Classification

Information is categorized as:

1. Public
2. Internal
3. Confidential
4. Restricted

Employees must handle data according to classification requirements.

### Device Security

* Screen locks must activate after 10 minutes of inactivity.
* Company devices may not be shared with family members or friends.
* Software installations require IT approval.

---

## 7. Performance Management

### Goal Setting

Employees and managers will establish:

* Annual objectives.
* Quarterly milestones.
* Development goals.

### Performance Reviews

Formal evaluations occur:

* Mid-year.
* End-of-year.

Review categories include:

* Technical competency.
* Collaboration.
* Leadership behaviors.
```

```
* Business impact.
* Professional development.

---

## 8. Compensation and Payroll

### Payroll Schedule

* Employees are paid on a biweekly basis.
* Direct deposit is required whenever legally permissible.

### Salary Reviews

Compensation reviews generally occur annually and consider:

* Individual performance.
* Market benchmarks.
* Company financial performance.
* Internal equity considerations.

---

## 9. Travel and Expense Policy

### Business Travel

Employees should select cost-effective travel options.

### Expense Reimbursement

Reimbursable expenses may include:

* Airfare.
* Lodging.
* Ground transportation.
* Approved meals.

### Documentation

Receipts are required for expenses exceeding $25.

Expense reports must be submitted within 30 days of travel completion.
```

```
---

## 10. Professional Development

The company encourages continuous learning.

### Annual Learning Budget

Employees receive up to $2,000 annually for:

* Training programs.
* Industry certifications.
* Professional conferences.
* Online educational courses.

Manager approval is required for expenses exceeding $1,000.

---

## 11. Conflict of Interest Policy

Employees must disclose any situation that could create:

* Financial conflicts.
* Vendor relationships.
* Outside employment conflicts.
* Competitive business interests.

The Ethics Committee reviews disclosures and determines appropriate
actions.

---

## 12. Social Media Policy

Employees may not:

* Reveal confidential information.
* Represent personal opinions as company positions.
* Share unreleased products or financial information.
```

```
Employees are encouraged to identify personal views as their own when
discussing industry topics online.

---

## 13. Workplace Health and Safety

Employees must:

* Report hazards immediately.
* Follow emergency procedures.
* Participate in required safety training.

Emergency evacuation drills may occur periodically.

---

## 14. Anti-Bribery and Anti-Corruption Policy

Employees may not:

* Offer improper payments.
* Accept inappropriate gifts.
* Engage in unethical business practices.

Gifts exceeding $100 in value must be reported to Compliance.

---

## 15. Attendance Policy

Employees are expected to:

* Maintain reliable attendance.
* Notify managers of absences as soon as possible.
* Arrive punctually for scheduled work commitments.

Repeated attendance issues may result in corrective action.

---

## 16. Employee Recognition Program
```

```
The company maintains recognition programs that may include:

* Peer-nominated awards.
* Innovation awards.
* Service anniversaries.
* Leadership recognition programs.

Recognition may include certificates, bonuses, or additional benefits.

---

## 17. Termination and Separation

Employment may end through:

* Resignation.
* Retirement.
* Layoff.
* Termination for cause.

Upon separation:

* Company property must be returned.
* System access will be revoked.
* Final compensation will be processed according to applicable laws.

Employees remain bound by confidentiality obligations after departure.

---

## 18. Ethics Hotline

Employees may confidentially report:

* Fraud.
* Harassment.
* Security concerns.
* Policy violations.
* Ethical concerns.

Retaliation against employees who report concerns in good faith is
strictly prohibited.
```

```
---

## 19. Artificial Intelligence Usage Policy

### Approved Use Cases

Employees may use approved AI systems for:

* Drafting content.
* Research assistance.
* Coding support.
* Data analysis.

### Restricted Activities

Employees may not:

* Upload confidential customer data into unapproved AI systems.
* Use AI-generated content without appropriate review.
* Represent AI-generated outputs as verified facts without validation.

Human review remains mandatory for all business-critical decisions.

---

## 20. Handbook Updates

The company reserves the right to modify, update, suspend, or replace policies at any time based on business, legal, or operational requirements.

Employees are responsible for reviewing policy updates and complying with the most current version of this handbook.

"""
```

```
raw_chunks = raw_handbook_text.split("##")

for chunk in raw_chunks:
    print(chunk)
    print("-----------------------------------------------")

```

```
hr_bot('What is the capital of France?')
```

Practice Challenge: "The Update Protocol"

Scenario: The CEO just announced a new policy: *"Fridays are now 'No Meeting Fridays' across the whole company."* You need to update the AI's memory without rewriting the whole script.

Your Task:

1. **Create a new variable `new_policy = "4. Meeting Policy: Fridays are designated as 'No Meeting Fridays' company-wide."`**
2. **Use the `collection.add()` function to insert this single new chunk into your ChromaDB collection. Give it the ID `"chunk_3"`.**
3. **Call `hr_bot("Can I schedule a meeting on Friday?")` to test if the bot learned the new rule.**

123991?")]})
result['messages'][-1]
```

```
# Challenge 1: The "News Anchor"
# Scenario: You want a quick summary of current events.
# Task: Ask the super_agent to:
# "Search for the latest news about Artificial Intelligence today and
summarize the top 3 points in a bulleted list."
```

```
# Challenge 2: The "Data Analyst"
# Scenario: You need to do math based on live, real-world data.
# Task: Ask the super_agent to:
# "Search for the current population of the United States. Then, use
the calculator to find out what 10% of that population is."
```

—----------

16th June 2026

```
from langchain_core.tools import tool
```

```
@tool
```

Tool decorator -> Tells the LLM, that this is a tool, use carefully!

Practice Challenge 3: The "Game Master" (Fixing Randomness)

The Flaw: If you ask an LLM to "Pick a random number between 1 and 10," it does not actually generate a random number. It just predicts the most likely number based on human text data (which is usually 7).

The Solution: We need to build a Python tool that uses the `random` library to force true, mathematical randomness, and give it to our LangGraph Agent.

Your Task:

1. **Import the random library (`import random`).**
2. **Create a new tool called `roll_dice` using the `@tool` decorator.**
3. **The tool should take `sides: int` as an input (e.g., 6 for a standard die, 20 for a D&D die).**
4. **Inside the tool, use `random.randint(1, sides)` to get the result. Return it as a string.**
5. **Combine this new tool with the multiply tool we built earlier into a new `game_agent` using `create_react_agent`.**
6. **Ask the agent: *"Roll a 20-sided die. Then, multiply the result by 5."***

```
pip install langchain-groq -q
```

```
from google.colab import userdata
```

```
my_api_key = userdata.get('groq_api')

from langchain_groq import ChatGroq

llm = ChatGroq(
    model = 'llama-3.3-70b-versatile',
    api_key = my_api_key,
    temperature = 0.0 # 0 for factual answer
)
```

```
from langchain_core.tools import tool
import random

@tool
def multiply(a: int, b: int) -> int:
    """Multiplies two integers together. Use this tool whenever you
need to perform calculation"""

    print("⭐Multiply function called")
    return a*b

@tool
def roll_dice(sides: int) -> str:
    """Use this tool to roll a die. You can decide the number of sides
the die has"""
    print("⭐Roll Die function called")
    num = random.randint(1, sides)
    return str(num)

tools = [multiply, roll_dice]
```

```
system_prompt_text = """
You are a helpful assistant. Use the correct tools in the correct order
to solve the user's query
"""

from langchain_core.messages import SystemMessage
from langgraph.prebuilt import create_react_agent

system_message = SystemMessage(content=system_prompt_text)

game_agent = create_react_agent(llm, tools, prompt=system_message)
```

```
result = game_agent.invoke({"messages": [("user", "Roll a 20-sided die. Then, multiply the result by 5.")]})
print(result['messages'][-1].content)
```

Practice Challenge 4: The "System Monitor" (Strict Anomaly Detection)

The Flaw: LLMs are "fuzzy" thinkers. If you ask an LLM to check if a server temperature of 91°C is dangerous, it might write a long paragraph about thermal dynamics instead of just giving you a strict "YES/NO" alert.

The Solution: We write an Anomaly Detection tool. Python handles the strict logic (`if > 90`), and the LLM simply acts as the messenger.

Your Task:

1. **Create a tool called `detect_anomaly` using the `@tool` decorator.**
2. **It should take a `temperature: float` as input.**
3. **Write a simple Python `if/else` statement inside:**
    - **If the temperature is strictly greater than `90.0`, return `"🚨 ANOMALY DETECTED: Critical Failure Risk!"`**
    - **Else, return `"✅ Status Normal."`**
4. **Create a new `monitor_agent` using `create_react_agent` with this tool.**
5. **Ask the agent: *"Check the server. The current temperature is 94.5 degrees. Is there an issue?"***

```
!pip install duckduckgo-search langchain_community langgraph beautifulsoup4 requests

```
# 2. The Master Instruction (Fulfilling the Capstone Rubric)
system_instruction = """
You are a Senior Investment Analyst.
When asked to research a company, you must follow this exact process:

1. PLAN & RESEARCH: Use the `web_search` tool to find the most recent
news about the company.
2. SCRAPE: Find at least ONE interesting URL from the search results
and use the `scrape_website` tool to read the article.
3. ANALYZE: Review the data to identify "Bullish" (positive growth) and
"Bearish" (negative risk) sentiments.
4. REPORT: Generate a final Investment Memo formatted strictly in
Markdown.

Your final output MUST look exactly like this structure:

# Investment Memo: [Company Name]
**Date of Research:** [Current Date]

## 1. Company Overview & Recent News
[Summary of what the company is doing right now]

## 2. Bullish Sentiment 📈
* [Positive point 1]
* [Positive point 2]

## 3. Bearish Sentiment 📉
* [Negative point 1]
* [Negative point 2]

## 4. Final Analyst Conclusion
[Your final verdict]

    print('\n\n')
```

Challenge 1 (Easy)

Start a conversation where you tell the agent your favourite programming language and favourite food in two separate messages. Then in a third message, ask it to repeat both back to you.

Challenge 2 (Medium)

Simulate two different students having separate conversations with the agent. Student A says their name is Priya and she studies biology. Student B says his name is Ravi and he studies physics. Then ask both "What do I study?" and verify the agent keeps them separate.

Challenge 3 (Hard)

Build a simple number tracking conversation. Tell the agent three numbers across three separate messages. Then ask it to add all three numbers together. The agent must use the `add` tool and its memory to answer.

plain text for now)
my_text = """
Artificial Intelligence is a branch of computer science focused on
building machines that can perform tasks that typically require human
intelligence.

Machine Learning is a subset of AI where systems learn from data
instead of being explicitly programmed. The more data you give it, the
better it gets.

Deep Learning is a subset of Machine Learning that uses neural networks
with many layers. It is especially good at image and speech
recognition.

Natural Language Processing (NLP) is the branch of AI that deals with
text and language. ChatGPT is an example of an NLP model.

Reinforcement Learning is a type of Machine Learning where an agent
learns by taking actions and receiving rewards or punishments. It is
used in robotics and games.
"""
```

```
# Split into chunks
splitter = RecursiveCharacterTextSplitter(chunk_size=200,

    chunks = retriever.invoke(question)

    return " ".join([c.page_content for c in chunks])
    # using for loop, I am going to each chunk (we have retrieved top 2
chunks), and extracting page_content and joining with a " "
```

```
# Add the rag agent as a tool to your langgraph.
```

Challenge 1 (Easy)
Add 2–3 sentences about yourself (your name, what you study, your city) as the document text. Build the RAG pipeline on it. Then ask questions like "Where does this person live?" and confirm it answers from your text.

Create a small "company FAQ" document with 4–5 made-up Q&A pairs (office timings, leave policy, etc). Build RAG on it. Test that the agent answers from the doc for known questions and says it doesn't know for unknown ones.

Build a RAG agent with memory. Load a document about any topic you like. Have a 3-turn conversation where turn 1 asks a basic question, turn 2 asks a follow-up that requires remembering turn 1, and turn 3 asks something not in the document (so it falls back to web search).
